

Projet SIO-Shoes : site « e-commerce » avec Symfony

Partie 2 : formulaire d'inscription et de connexion

1. Créer le système d'authentification.

Exécutez la commande `symfony console make:user` (appuyez sur la touche « entrée » pour choisir les valeurs par défaut) :

```
PS C:\Symfony\e-commerce> symfony console make:user

The name of the security user class (e.g. User) [User]:
>

Do you want to store user data in the database (via Doctrine)? (yes/no) [yes]:
>

Enter a property name that will be the unique "display" name for the user (e.g. email, username, uuid) [email]:
>

Will this app need to hash/check user passwords? Choose No if passwords are not needed or will be checked/hashed
by some other system (e.g. a single sign-on server).
Does this app need to hash/check user passwords? (yes/no) [yes]:
>

created: src/Entity/User.php
created: src/Repository/UserRepository.php
updated: src/Entity/User.php
updated: config/packages/security.yaml

Success!

Next Steps:
- Review your new App\Entity\User class.
- Use make:entity to add more fields to your User entity and then run make:migration.
- Create a way to authenticate! See https://symfony.com/doc/current/security.html
```

2. Préparer la migration pour créer la table user dans la BDD.

`symfony console make:migration`

Attention : vérifiez que la version de MariaDB est bien celle déclarée dans le fichier « .env ».

```
PS C:\Symfony\e-commerce> symfony console make:migration
created: migrations/Version20250723102921.php

Success!

Review the new migration then run it with symfony.exe console doctrine:migrations:migrate
See https://symfony.com/doc/current/bundles/DoctrineMigrationsBundle/index.html
```

3. Exécuter la migration avec doctrine.

`symfony console doctrine:migration:migrate`

```
PS C:\Symfony\e-commerce> symfony console doctrine:migration:migrate

WARNING! You are about to execute a migration in database "sio-shop-test" that could result
in schema changes and data loss. Are you sure you wish to continue? (yes/no) [yes]:
>

[notice] Migrating up to DoctrineMigrations\Version20250723102921
[notice] finished in 31.4ms, used 22M memory, 1 migrations executed, 2 sql queries

[OK] Successfully migrated to version: DoctrineMigrations\Version20250723102921
```

La table user a été créée dans la BDD, ainsi que deux nouvelles tables. La table « doctrine_migration_versions » permet de visualiser les migrations effectuées.

4. Création du formulaire de connexion.

```
symfony console make:security:form-login
```

```
Choose a name for the controller class (e.g. SecurityController) [SecurityController]:
>

Do you want to generate a '/logout' URL? (yes/no) [yes]:
>

Do you want to generate PHPUnit tests? [Experimental] (yes/no) [no]:
>

created: src/Controller/SecurityController.php
created: templates/security/login.html.twig
updated: config/packages/security.yaml

Success!

Next: Review and adapt the login template: security/login.html.twig to suit your needs.
```

Attention : symfony console make:auth est deprecated !

5. Ajouter un formulaire d'inscription :

```
symfony console make:registration-form
```

```
PS C:\Symfony\e-commerce> symfony console make:registration-form
Creating a registration form for App\Entity\User

Do you want to add a #[UniqueEntity] validation attribute to your User class to make sure duplicate
accounts aren't created? (yes/no) [yes]:
>

Do you want to send an email to verify the user's email address after registration? (yes/no) [yes]:
> no

Do you want to automatically authenticate the user after registration? (yes/no) [yes]:
>

Do you want to generate PHPUnit tests? [Experimental] (yes/no) [no]:
>

updated: src/Entity/User.php
created: src/Form/RegistrationForm.php
created: src/Controller/RegistrationController.php
created: templates/registration/register.html.twig

Success!

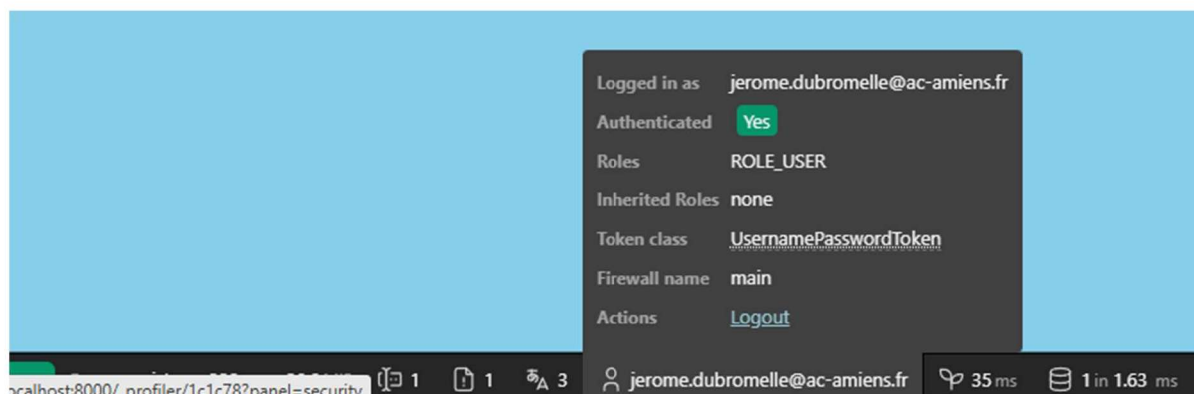

Next:
Make any changes you need to the form, controller & template.

Then open your browser, go to "/register" and enjoy your new form!
```

6. Créer un utilisateur et vérifier avec le profiler :

Ouvrez la page `localhost:8000/register` et créez un utilisateur

Observez le résultat dans le « profiler » de symfony. Allez dans le bas de la page et vérifiez que l'utilisateur créé est bien connecté :

7. Ajouter le nom et le prénom dans le formulaire d'inscription.

Allez dans `src\form\RegistrationForm.php` et ajoutez les champs 'firstName' et 'lastName' :

```
public function buildForm(FormBuilderInterface $builder, array $options): void
{
    $builder
        ->add('email')
        ->add('agreeTerms', CheckboxType::class, [
            'mapped' => false,
            'constraints' => [
                new IsTrue([
                    'message' => 'You should agree to our terms.',
                ]),
            ],
        ],
    ])
    ->add('firstName')
    ->add('lastName')
    ...
}
```

8. Modifier l'entité « User ».

Lancez la commande `symfony console make:entity User`

```

Your entity already exists! So let's add some new fields!

New property name (press <return> to stop adding fields):
> firstName

Field type (enter ? to see all types) [string]:
>

Field length [255]:
> 255

Can this field be null in the database (nullable) (yes/no) [no]:
>

updated: src/Entity/User.php

Add another property? Enter the property name (or press <return> to stop adding fields):
> lastName

Field type (enter ? to see all types) [string]:
>

Field length [255]:
>

Can this field be null in the database (nullable) (yes/no) [no]:
>

updated: src/Entity/User.php

```

9. Préparer la migration pour ajouter les champs « firstName » et « lastName » dans la table user de la base de données.

Lancez la commande `symfony console make:migration`

10. Exécuter la migration avec doctrine

`symfony console doctrine:migration:migrate`

11. Modifier la vue pour afficher les champs « firstName » et « lastName ».

Allez dans `templates\registration\register.html.twig` et ajoutez les 2 champs :

```

{% extends 'base.html.twig' %}

{% block title %}Register{% endblock %}

{% block body %}
    <h1>Inscription</h1>
    {{ form_errors(registrationForm) }}
    {{ form_start(registrationForm) }}
        {{ form_row(registrationForm.email) }}
        {{ form_row(registrationForm.firstName) }}
        {{ form_row(registrationForm.lastName) }}
        {{ form_widget(registrationForm.plainPassword,{label:'Password'}) }}
        {{ form_row(registrationForm.agreeTerms) }}
        <button type="submit" class="btn">Register</button>
    {{ form_end(registrationForm) }}
{% endblock %}

```
